

Eight-state structure of evidence dependence (frozen Phase II audit triplets)

(a) Eight-state object (B, R, I)

A^S : pairwise accuracy on the independent static set. Never computed on audit bases.
 $A^B = P(B=1)$: audit-base accuracy. Matching uses A^S , never A^B .
 $RA = P(R=1 | B=1)$, $II = P(I=1 | B=1)$, $D = (RA, II)$.
Predeclared matching remains $|\Delta A^S| \leq 1$ pp. Other ε are post-hoc sensitivity.

Given $B = 1$

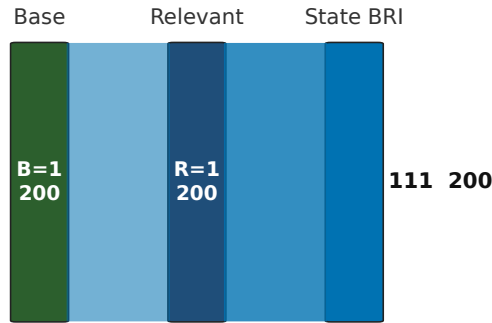

RA collapses the two columns
 $(111 + 110) / A^B$

II collapses the two rows
 $(111 + 101) / A^B$

π_{101} is the mass those
two margins hide.

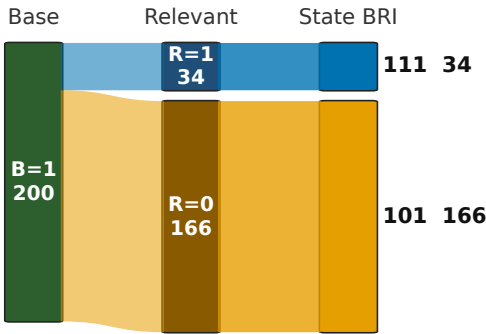

(b) Qwen · Attribute

$A^B = 1.00$ $RA = 1.00$ $II = 1.00$ $F_R = 1.00$

(c) Qwen · Count

$A^B = 1.00$ $RA = 0.17$ $II = 1.00$ $F_R = 0.17$

166/200: gold flips, predicted letter unchanged.

(d) $\pi_{101} = P(B=1, R=0, I=1)$ — mass hidden when RA/II are reported alone
